Patent No. 5989519
GENERAL INFORMATION: Richard T
APPLICANT: Buttram, Scott
TITLE OF INVENTION: Technetium-99m Labeled Peptides for TITLE OF INVENTION: Imaging Inflammation
NUMBER OF SEQUENCES: 37
CORRESPONDENCE ADDRESS:
                              COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/170,299
FILING DATE: 09-FEB-1995
CLASSIFICATION: 514
ATTORNEY/AGENT INFORMATION:
NAME: NO. 6086849nan, Kevin E
REGISTRATION NUMBER: 35,303
REFERENCE/DOCKET NUMBER: 35,303
REFERENCE/DOCKET NUMBER: 92,205-H
TELECOMUNICATION INFORMATION:
TELEPANS: 312-715-100
TELEFAX: 312-715-100
TELEFAX: 312-715-100
TELEFAX: 312-715-100
TELEX: 910-21-5317
INPORMATION POR SEQ ID NO: SEQUENCE CHARACTERISTICS:
LENGTH: 28 amino acide

is Sequence 28870. Application US/09252991A

is Sequence 28870. Application US/09252991A

is Patent No. 6551795

is GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

APPLICANT: Marc J. Rubenfield et al.

ITILE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

ITILE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERABEUTICS

FILE REFERENCE: 107196.136

CURRENT RILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

iENGTH: 1020

Patent No. 6551795
BATENT NIF 6551795
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: A
                                                                                                                                                                                                 Sequence 283, Application US/08311731A
Sequence 283, Application US/08311731A
Sequence 283.6
GENERAL INFORMATION:
APPLICANT: SMITH, DOUGLAS
APPLICANT: MAO, JEN-I
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES
TITLE OF INVENTION: BELATING TO MYCOBACTERIUM TUBERCULOSIS AND LAPRAE FOR TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
TITLE OF SQUENCES: 411
CORRESPONDENCE ADDRESS:
ADDRESSEE: WOLF, GREENFIELD & SACKS, P.C.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 30538
LENGTH: 266
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 52, Application US/08311731A
Patent No. 6583266

Matsueda GR, Haber E; WPI; 1987-306855/43. Screening of fibrin-specific monoclonal antibodies - by contact with immobilised crosslinked fibrin clot and screening with detectable labelling step.

Disclosure, Page 7; 41pp; English.

The MAbs are specific to fibrin without fibrinogen cross-reactivity. They have increased binding to in vitro and in vivo thrombi. The MAbs can be used in immunoasays for fibrin in the presence of fibrinogen or other proteins. They can be used as immunoaffinity ligands for the purification of fibrin. (Updated on 03-OCT-2002 to add missing OS field.) (Updated on

```
Synthetic epitopic peptide(s) of variable length - capable of eliciting fibrin specific antibodies free of fibrinogen cross-reactivity.
                                                                                                                                         Fibrin-specific epitopic peptides; thrombi detection; fibrinogen; antifibrin-specific monoclonal antibodies.

They are particularly useful in detection of fibrin and thrombi. (Updated on 25-MAR-2003 to correct PA field.)

                                      AAR65789-R65794 are synthetic peptides comprising fibrin-specific epitopic sequences, they can be used to prepare hybridoma cell lines, which produce antifibrin-specific monoclonal antibodies substantially devoid of fibrinogen cross-reactivity. These antibodies are useful in the in vivo and in vitro detection of thrombi and fibrin deposits. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibitor; thrombin; chimeric molecule; fibrin-binding; antibody; hirudin; monoclonal; 59D8; fibrinopeptide B; coagulation; P79; coronary stent implantation; adjunctive therapy; fibrinogen; haemorrhage.

New anti-human fibrin mono: clonal antibody, for diagnosing thrombosis prepd. from hybridoma obtd. by applying cell fusion mouse spleen and mouse myeloma-cells, and measures human fibrin.
                                                                                                                                                          The peptide is linked to a carrier protein via a linking agent and u to immunise mice. The mouse spleen cells and amyeloma cell line can fused to produce a hybridoma secreting MAbs which bind specifically human fibrin but not fibrinogen. (Updated on 25-MAR-2003 to correct field.)

                                                                                                                                                                                                                                                                                           This sequence represents beta-peptide which was used to raise the monoclonal antibody 5998. The antibody binds fibrin and may be used in the chimeric molecule of the invention. The chimeric molecule further comprises a thrombin inhibitor linked to the fibrin-binding antibody through a covalent linkage. The chimeric molecule allows fibrin-specific antibody targetting of hirudin and other thrombin inhibtors, which is more potent than thrombin on its own. The epitope to which 5908 binds becomes available only after thrombin cleaves fibrinopeptide B. The chimeric protein may be used for preventing coagulation of the blood. Anti-thrombin targetting can be esp. useful in highly thrombogenic situations such as coronary stent implantation and can be used as an adjunctive therapy with highly selective thrombolytic agents. The thrombin inhibitor is localised to sites of thrombin activity by the antibody which binds to thrombin but does not cross react with uncleaved fibrinogen. The selectivity of inhibition allows the total amount of thrombin inhibitor used to be substantially reduced, resulting in a coronary process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                   Fibrin-binding antibody linked to thrombin inhibitor - useful for preventing blood coagulation by specifically targetting inhibitor to site

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hybrid monoclonal antibody - used for prepn. of thrombolytic having drug increased thrombolytic activity and specificity and reduced reactivity to fibrinogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human fibrin beta-chain peptides A and B were synthesised and coupled to BSA for injection into mice. The peptides were used to raise antibodies to human fibrin. Monoclonal antibodies specific for fibrin are used in the production of bispecific amonoclonal antibodies which also recognise truncated tPA muteins lacking the finger, EGF and Kringle I domains

This sequence represents a synthetic beta-peptide which was used to immunopurify the monoclonal antibody 59D8 which was raised against beta-peptide (see also AAR63569). The antibody binds fibrin and may be used in the chimmeric molecule of the invention. The chimmeric molecule further comprises a thrombin inhibitor linked to the fibrin-binding antibody through a covalent linkage. The chimmeric molecule allows fibrin-specific antibody targetting of hirudin and other thrombin inhibitors, which is more potent than thrombin on its own. The epitope to which 59D8 binds becomes available only after thrombin cleaves fibrinopeptide B. The chimmeric protein may be used for preventing coagulation of the blood. Anti-thrombin targetting can be esp. useful in highly thrombogenic situations such as coronary stent implantation and can be used as an ediunctive therapy with highly selective thrombolytic agents. The chrombin inhibitor is localised to sites of thrombin activity by the artibody which binds to thrombin but does not cross react with uncleaved fibrinogen. The selectivity of inhibition allows the total amount of thrombin inhibitor used to be substantially reduced, resulting in a reduced potential for generalised haemorrhaging. (Updated on 25-MAR-2003) to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      preventing blood coagulation by specifically targetting inhibitor to site of thrombin activity.
                                                                                                                                                                Inhibitor; thrombin; chimeric molecule; fibrin-binding; antibody; hirudin; monoclonal; 59D8; fibrinopeptide B; coagulation; P79; coronary stent implantation; adjunctive therapy; fibrinogen; haemorrhage.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAR65789-R65794 are synthetic peptides comprising fibrin-specific epitopic sequences, they can be used to prepare hybridoma cell lines, which produce antifibrin-specific monoclonal antibodies substantially devoid of fibrinogen cross-reactivity. These antibodies are useful in the in vivo and in vitro detection of thrombi and fibrin deposits. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic epitopic peptide(s) of variable length - capable of eliciting fibrin specific antibodies free of fibrinogen cross-reactivity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a method of inducing proinflammatory effects in synovial or fibroblast cells comprising exposing the cells to a specific teraspeptide (GPRP) peptide (I). (I) is used for inducing proinflammatory effects in synovial or fibroblast cells. An analogue of (I) is used for treating or preventing inflammation of a synovial joint or rheumatoid arthritis in a subject. (I) is used to identify a receptor for (I) comprising exposing several fibroblastic cells or synovial cells to (I).
                                                                                                                                                                                                                                                        not with human fibrinogen. Specifically when the MAb reacts with ureatreated des-AABB fibrin the reaction is not inhibited by peptides corresponding to fibrinogen A-alpha-chain residues 17-26 (AAW11931), B-beta-chain residues 15-24 (AAW11932) or gamma-chain residues 312-324 (AAW11933). The MAb is useful in immunoassays for solubbe fibrin in plasma samples (e.g. by sandwich immunoassay), particularly for the diagnosis of pathological conditions such as disseminated intravascular
                                                                                                                                                                                                                        A novel monoclonal antibody (MAb) reacts with human soluble fibrin, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inducing proinflammatory effects in human synovial or fibroblast cells comprises using a specific tetrapeptide which can also identify a receptor to the tetrapeptide.
Monoclonal antibody reactive with soluble human fibrin - but not with fibrinogen, is useful for fibrin immunoassay in plasma specimens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bi:specific antibody useful for treating thrombotic obstructive diseases e.g. cardiac infrarction - comprises antihrombus antibody variable region and anti-thrombolytic substance antibody variable region with no heavy, chain constant region domains 2 and 3.
(I) Can identify, isolate and clone the cell receptor to which it binds. This is the amino acid sequence of a control peptide associated with the ihlbition of fibrin polymerisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents an N-terminal peptide of human fibrin. It was used in the production of bispecific monoclonal antibodies which are specific for fibrins, but do not bind fibrinogen, and and are specific for anti-thrombolytic substance. The compsn. contg. these Abs lacks the side effects of prior art Ab targetted thrombolytic agents and has enhanced thrombolytic activity. (Updated on 25-MAR-2003 to correct PN

The peptide was used to raise antibodies to human fibrin. Monoclonal antibodies specific for fibrin are used in the production of bispecific monoclonal antibodies which also recognise truncated tPA mutehis lacking the finger, EGF and Kringle 1
                                                                                                                                                                                                               Tissue plasminogen activator; t-PA; mutein; fibrin; antigen; anti-fibrin; monoclonal antibody; hybridoma; thrombolysis antithrombotic agent; bispecific antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hybrid monoclonal antibody - used for prepn. of thrombolytic having drug increased thrombolytic activity and specificity and reduced reactivity to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tissue plasminogen activator; t-PA; mutein; fibrin; antigen; anti-fibrin; monoclonal antibody; hybridoma; thrombolysis antithrombotic agent; bispecific antibody.

The specification describes peptides which correspond to portions of fibrin/fibrinogen beta chain sequencés, and act as modulators of fibrin fibrinogen beta chain sequencés, and act as modulators of fibrin E activity, and in turn modulators of fibrin E effects. Such effects include induction of call proliferation, angiogenesis fibrogenesis and collagen synthesis. The peptides are used for wound heart muscle or limb replacement surgery. They are also used for treating ischaemia, reduction of scarring, and prevention of restenosis. The peptides may also be used for treating atherogenesis, rheumatoid carribritis, diabetes, renal disease, psoriassis, macular degeneration, or cancer. The peptides are also useful for modifying fibrin glues, and may be incorporated into a stent which is introduced into the arteries of the
                                                                                                                                                                                                                                                               patient during an angioplasty procedure for preventing restenosis. BAB78036-3-38 represent peptides derived from fibrin/fibrinogen beta chain sequences. The peptides are derived from the region where plasmin cleaves the molecule, and contain a Ceterminal Cys which does not appear in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tissue plasminogen activator; t-PA; mutein; fibrin; antigen; anti-fibrin; monoclonal antibody; hybridoma; thrombolysis antithrombotic agent;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         monoclonal antibody - used for prepn. of thrombolytic having drug sed thrombolytic activity and specificity and reduced reactivity to

Monoclonal antibodies specific for fibrin are used in the production of bispecific monoclonal antibodies which also recognise truncated tPA muteins lacking the finger, EGF and Kringle 1 domains
                                                                                                                                                                                                                                                                                                                                                                                                     Length 14;

                                                                                                                                                                                                                                                                                                            Human fibrin beta-chain peptides A and B were synthesised and coupled to BSA for injection into mice. The peptides were used to raise antibodies to human fibrin. Monoclonal antibodies specific for fibrin are used in the production of bispecific monoclonal antibodies which also recognise truncated tPA muteins lacking the finger, EGF and Kringle I domains

Treating or preventing thrombin-induced coagulation of blood for treating a disease condition such as stroke, myocardial infarction, sickle-cell crisis or venous thrombosis by administering a SdrG protein.
                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method for treating or preventing thrombin-
induced cosqulation of blood by administering a SdrG protein. The method
is sued for preparing a composition for treating myocardial infarction,
stroke, sickle-cell crisis or venous thrombosis. The present sequence is
Staphylococcus epidermidis fibrinogen (Fg) Bbeta chain peptide used to
illustrate the method of the invention
                              Thrombin-induced blood coagulation; myocardial infarction; SdrG protein; sickle-cell crisis; venous thrombosis; stroke; therapy; anticoagulant;

    S. epidermidis fibrinogen (Fg) Bbeta chain peptide, betal-25.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match 100.0%; Score 41; DB 6; Length 25; Best Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treating or preventing thrombin-induced coagulation of blood for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method for treating or preventing thrombin-
induced coagulation of blood by administering a SdrG protein. The method
is sued for preparing a composition for treating myocardial infarction,
stroke, sickle-cell crisis or venous thrombosis. The present sequence is
Staphylococcus epidermidis fibrinogen (Fg) Bbeta chain peptide used to
illustrate the method of the invention
                                                                                                                                                                                                                                                                                                       Thrombin-induced blood coagulation, myocardial infarction, SdrG protain, sickle-cell crisis, venous thrombosis, stroke, therapy, anticoagulant,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                a disease condition such as stroke, myocardial infarction, sickle-cell crisis or venous thrombosis by administering a SdrG protein.

                                                                                                                                                                       셤
                                                                                                                                                                                                                                     ö
                                                                                                               The sequence is that of a specific binding peptide used as part of a reagent for preparing a scintigraphic imaging agent for imaging sites within a mammalian body. In this the peptide is covalently linked to a radiolabel-binding moiety which is capable of forming a complex with a radiolsotope, pref. technetium-99M. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a reagent (A) for producing an agent for imaging sites in a mammal comprising a specific binding peptide (I) of 3-100 amino acids and, covalently linked to the side chain of an amino acid, residue in (I), a radiolabel binding group (II). Also new are (I) scintigraphic imaging agents (SIA) containing (A) in which (II) is bound to a radiolabel; (2) kits for preparation of a radiopharmaceutical comprising (A) and enough reducing agent to label (A) with Technetium-99m. Depending on the nature of (I), SIA can be used to image e.g:

tumours that express somatostatin receptors; leukocytes; atherosclerotic plaque, and deep vein thrombosis. Attachment of (II) to a sidechain avoids any interference with the specific binding properties of (I) and makes possible derivatisation of cyclic peptides (which are more resistent to proceolysis). Images may be recorded only a few minutes after injection of SIA. This is the amino acid sequence of a peptide associated with the imaging methods of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to peptides based on the alpha- and beta-chain sequences of fibrin/fibrinogen, which are capable of acting as fibrin antagonists. These are used for the therapy of local and generalised inflammation associated with infection, autoimmune reactions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptides or proteins based on fibrin or fibrinogen sequences, useful for combating fibrin-mediated disorders such as inflammation, transplant rejection, arteriosclerosis and reperfusion damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          for the

New peptides are claimed which are leukocyte binding peptides having covalently bound to them a moiety which can bind a Tc-99m radiolabel. The epetides having Tc-99m bound to them are useful as scintigraphic imaging agents for imaging sites of infection and inflammation in the mammalian body, e.g. caused by ischaemia, inflammatory bowel disorder, arthritis or theores. The present sequence is a specifically claimed example of such a peptide derived from fibrinopeptide B chain. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                    Leukocyte binding peptide; fibrinopeptide B chain; scintigraphic imaging; inflammatiom site; technetium 99m.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Scintigraphic imaging agent for sites of inflammation - comprising leukocyte-binding peptide bound technetium-99m via binding moiety.
                                                                                                   Leukocyte-binding peptide which can bind to technetium-99m
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 41; DB 2; Length 30; ilarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                             The present invention describes a composition (C) comprising a radiopharmaceutical precursor and a stabiliser selected from hydrophilic thioether (I) and/or hydrophilic 6-hydroxy-chroman derivative (II). Also described: (1) stabilishing a radiopharmaceutical comprising: combining the radiopharmaceutical precursor with (I) and/or (II) in a container, and adding a radionuclide to the container; and (2) a kit comprising a sealed vial containing the radiopharmaceutical precursor; and il) and/or (II). (C) can be used to increase the shelf life of diagnostic and therapeutic radiopharmaceutical precursors in nuclear medicine. The stabilisers maintain the radiocharmaceutical purity of the radiopharmaceutical containing the radiocharmaceutical precursors in nuclear medicine. The stabilisers maintain the radiocharmaceutical precursors in containing a vide variety of radiopharmaceutical. (C) is suitable for stabilising a wide variety of radiopharmaceuticals. The present sequence represents a specifically contained targeting moiety peptide for a composition from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                 Composition useful for increasing shelf life of diagnostic and therapeutic radiopharmaceuticals, comprising radiopharmaceutical precursor and hydrophilic thioether and/or hydrophilic 6-hydroxy-chroman
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Radiopharmaceutical composition stabilising hydrophilic thioether #5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            radiopharmaceutical precursor; hydrophilic thioether;

Composition used in diagnosis and therapy comprises stabilizing amount of hydrophilic thioether and radiopharmaceutical precursor or peptide or benzodiazepine derivative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention decribes a composition comprising a radiopharmaceutical precursor and a stabilising amount of a hydrophilic thioether. The composition is useful as stabiliser of radiopharmaceutical compositions for use in diagnosis and therapy. The composition is particularly useful for increasing the shelf life of diagnostic or therapeutic radiopharmaceuticals. This the amino acid sequence of a hydrophilic thioether used in the method of stabilising radiopharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  radiopharmaceutical precursor; hydrophilic 6-hydroxy-chroman derivative; stabiliser; radiopharmaceutical composition; diagnosis; therapy; shelf life.

                                                                                                                                                              The invention describes a composition comprising a radiopharmaceutical precursor and a hydrophilic 6-hydroxy-chroman derivative. The composition is useful as stabilisers of radiopharmaceutical compositions for use in diagnosis and therapy. The composition is particularly useful for increasing the shelf life of diagnostic or therapeutic radiopharmaceuticals. This is the amino acid sequence of a peptide used in the stabilisation of radiopharmaceutical compositions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; cytokine; cell proliferation; cell differentiation; growth factor;

condition also relates to vectors and recombinant borspectures. Sequences ABA08225-ABA0924 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, and methods of identifying compounds which to polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth activity; in memomodulatory activity; tissue growth activity; chrombolycic or chemokinetic activities; paemostatic or may be conditions activities, receptor or ligand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis.

Compositions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoleted disporders (e.g., myeloid or lymphoid cell cancers, haematopoletic disporders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), proliferative retinopathy, atherosclerosis, coronary heart disease, arreadis activities may be used to promote wound repair (or nucleic acids encoding them) may be used to promote wound repair (or nucleic acids encoding them) may be used to promote wound tell souterial and fungal infections in addition to immune disorders.

Dependent of growth. For example, such polypeptides may be used to commune to viral, near the angular or arthrity may be used in cell cultures to gromote cell growth. For example, such polypeptides may be used to neuroepithelalial cells cancer activity may be used by any any and any 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

colypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying at therapeutic agent corpus in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptides. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins or are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopolesis; and in bone, cartilage, tendon and an autimulation; as anti-inflammatory agents; and in treatment of leukaemias. ANU29510-ANU33304 represent the amino acid sequences of novel human secreted proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                               Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.
                                                                                                                                                                      The invention relates to novel human secreted polypeptides. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 20; SEQ ID NO 24670; 1399pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is a polypeptide encoded by one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, vaccination, gene therapy, nutritional supplement,

The invention relates to human polynucleotides (AAI79941-AAI93841) and cytokine, cells (AAO0010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping.
                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     obtaining cDNAs and genomic DNAs that correspond to 3 mais and diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for

```

The present sequence is a polypeptide encoded by one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where included. 5' ESTS are derived from mina, with intext 5' ends and can included. 5' ESTS are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTS are also used in diagnostic, forensic, gene therapy and chromosome

The polymucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A control of the invention may have a use in gene therapy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine cutoimmune/inflammatory disorder, developmental disorders, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp confluence may also be used in genetic mapping, in identifying individuals confluence may also be used in genetic mapping, in identifying individuals confluence pological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline confluence. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                ABM85149 standard; protein; 455 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 27; Page; 190pp; English

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnost a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp concerns also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single mucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A polymucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, dastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp concluse may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp concluse may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single mucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers a dithp protein of the invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A polymucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine disorder, neurological disorder, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, are molecular weight markers and for somatic or germline invention. Note: The sequence fact for this patent is not represented in the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or in gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   wright RJ, Bruns CM, Marjanovic MM, Shen F; e TA, Suchorolski MT, Altus CM, Pitts SJ, Elder LV; Delegeane AM, Panesar IS, Banville SC, Reddy TP; Blanchard JL, Panzer SR, Wang X, Au AP, Gerstin EH; Anderson SB, Rioux P, Shen EJ, Wu MC, Stuve LL; Spiro PA, Stewart RA, Wingrove J, Vitt UA, Kirton ES; GM, Policky JL, Hurwitz BL, Ma Y, Jackson JL, Gietzen Shi X, Suarez CJ;

```
The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 272 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnost a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp concernisms may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm

The invention relates to a composition comprising several cDNAs that are differentially expressed in a liver disorder. The composition is useful for treating liver disorder such as hyperlipidaemia, hypertension, type II diabetes, tumours of the liver and disorders of the inflammatory and immune response. The composition is useful for a high-throughput method of several molecules or compounds to identify a ligand which specifically binds a cDNA. A protein encoded by the cDNA is useful for high-throughput method for using a protein to screen several molecules or compounds to identify at least one ligand which specifically binds the protein which involves combining the protein encoded by the cDNA with several of molecules or compounds under conditions to allow specific or binding, and detecting specific binding between the protein and a molecule or compound, therefore identifying a ligand which specifically chinds the protein. The composition is useful for detecting and quantifying differential gene expression, can be used in gene therapy, to formulate prognosis and to design a treatment regimen and to monitor the efficacy of treatment. The present sequence represents the amino acid sequence of a protein encoded by a cDNA differentially expressed in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Composition comprising several cDNAs that are differentially expressed in treated human C3A liver cell cultures, useful for treating liver

                                                                                                                                        RESULT 40
                                                                                                                                                                      ADE76868
                                                                                                                                                                                                                                                      The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A puricleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine caused to diagnosial disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conflections manner and also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the gene therapy. The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Wright RJ, Bruns CM, Marjanovic MM, Shen F;
